

PAUL JOSHUA S. SELETARIA

Full-Stack .NET Developer

C# | .NET | ASP.NET | REST APIs | React.js | AngularJS | SQL

Developer Portfolio & Selected Technical Case Studies

Professional project descriptions are intentionally anonymized and exclude confidential source code, credentials, internal URLs, and client-sensitive information.

Professional Profile

Full-stack developer with almost four years of experience building, enhancing, migrating, and supporting enterprise web applications. My recent work has been backend-focused using C# and the .NET ecosystem, with hands-on experience in API development, database integration, application troubleshooting, server migration, and production support. I also have frontend experience with AngularJS, JavaScript, TypeScript, and React.js.

Core Technical Skills

Backend	C#, .NET Framework 4.7/4.8, ASP.NET MVC, ASP.NET Core, Web API, LINQ
Frontend	React.js, AngularJS, JavaScript, TypeScript, HTML, CSS, Bootstrap, Kendo UI
Databases	SQL Server, Oracle, PostgreSQL, MySQL
Integration	REST APIs, SOAP/Web Services, JSON, file-processing workflows
Tools & Delivery	Azure DevOps, Git, GitHub, Postman, Swagger, IIS, Visual Studio
Practices	Layered architecture, dependency injection, repository pattern, SOLID, Agile/Scrum

Selected Project Experience

Enterprise Wealth Management Platform

Role: .NET Developer

Technologies: C#, ASP.NET MVC, Web API, .NET Framework, LINQ, Oracle, PostgreSQL, IIS

Overview

Worked on an enterprise wealth management application supporting investment reporting, statement processing, and related internal workflows. My responsibilities included backend enhancements, API development, database integration, application migration, deployment activities, troubleshooting, and production support.

Key Contributions

- Developed and enhanced backend endpoints and application features using C# and .NET.
- Worked with Oracle and PostgreSQL for data retrieval, validation, and application integration.
- Supported the migration of web applications, web services, console applications, and scheduled processes to new server environments.
- Participated in .NET Framework upgrade activities and environment validation across development, UAT, and production.
- Investigated application and integration issues using application logs, IIS, database validation, Postman, browser tools, and debugging.
- Handled production support issues involving application configuration, server access, firewall or whitelisting dependencies, and web-service connectivity.

Selected Project Experience

E-Commerce Web Application

Role: Junior Software Developer / Full-Stack Developer

Technologies: AngularJS, JavaScript, TypeScript, C#/.NET, Web API, LINQ, Kendo UI

Overview

Contributed to a web-based e-commerce application, working across frontend functionality and backend integration. The role involved feature enhancements, UI behavior, data handling, API integration, and maintenance of existing application modules.

Key Contributions

- Implemented and enhanced frontend features using AngularJS, JavaScript, TypeScript, CSS, and Kendo UI.
- Integrated frontend modules with C#/.NET backend services and APIs.
- Worked on data-driven grids, confirmation flows, and application UI improvements.
- Contributed to invoice-related functionality and SMS gateway integration.
- Debugged data parsing, API response, and frontend integration issues.
- Worked with existing enterprise code while maintaining compatibility with established application workflows.

Technical Case Studies

1. File-Processing Workflow Redesign

Challenge

A legacy file-processing workflow depended on FTP-based file pickup. During an environment migration, the target setup introduced a different file-transfer constraint and the existing process could not be reused as-is.

Approach

I reviewed the existing processing flow and changed the application to retrieve files from a controlled local server directory. The scheduled process continued to read and process files through the existing business workflow while removing the dependency on the old FTP pickup mechanism.

Result

The redesign allowed the file-processing workflow to continue in the migrated environment while minimizing changes to the core processing logic.

2. Legacy Web-Service Mismatch Investigation

Challenge

During migration and testing, an environment was communicating with an outdated web service. The application depended on multiple services, and the source code for one legacy component was not readily available.

Approach

I traced the service references and application flow to identify which component was being called. I inspected the available compiled assembly to understand the legacy implementation and used the findings to support rebuilding and correcting the service setup for the migration.

Result

The investigation clarified the service dependency and helped resolve the environment mismatch affecting testing.

Technical Case Studies

3. Manual Reporting and Excel Export Enhancement

Challenge

Users relied on scheduled email reports, but reports could be missed when the server or scheduled process was unavailable.

Approach

I contributed to a manual reporting feature that allowed users to select a date, retrieve the corresponding records, and generate the report on demand. The implementation covered the user interface, controller-to-service flow, database query changes, and Excel export behavior.

Result

Users gained an alternative way to retrieve date-based reports instead of relying only on scheduled email delivery.

How I Approach Technical Problems

- Understand the expected workflow and reproduce the issue.
- Check application, IIS, and database logs for the first useful failure point.
- Validate APIs and integrations using tools such as Postman and browser developer tools.
- Trace the application flow through controller, service, repository, and database layers.
- Verify environment configuration and external dependencies such as server access, firewall rules, and service endpoints.
- Apply the smallest maintainable change, validate it, and document the deployment or troubleshooting steps.

Technical Focus

I am particularly interested in full-stack and .NET development roles where I can contribute to backend services, APIs, database-driven applications, and modern web interfaces. My experience in enterprise application support has also strengthened my ability to investigate issues across application, database, integration, and environment layers.

Professional Summary

- Almost 4 years of software development experience
- Backend-leaning full-stack .NET developer
- Enterprise application development and production support experience
- Hands-on API and database integration experience
- Experience with application and server migration activities
- Frontend experience with AngularJS, JavaScript, TypeScript, and React.js
